The truck can now tell if the scale is open

Aurora says its driverless trucks can now tell whether a weigh station is open and steer to an available scale lane on their own.

Open, which lane, which scale

Autonomous trucks have relied on voluntary inspections to bypass weigh stations, the letter says. It says the Aurora Driver can now handle three steps on its own.

Next, through the security gate

Aurora says that in November its trucks will drive directly to sites for several customers, through security checkpoints.

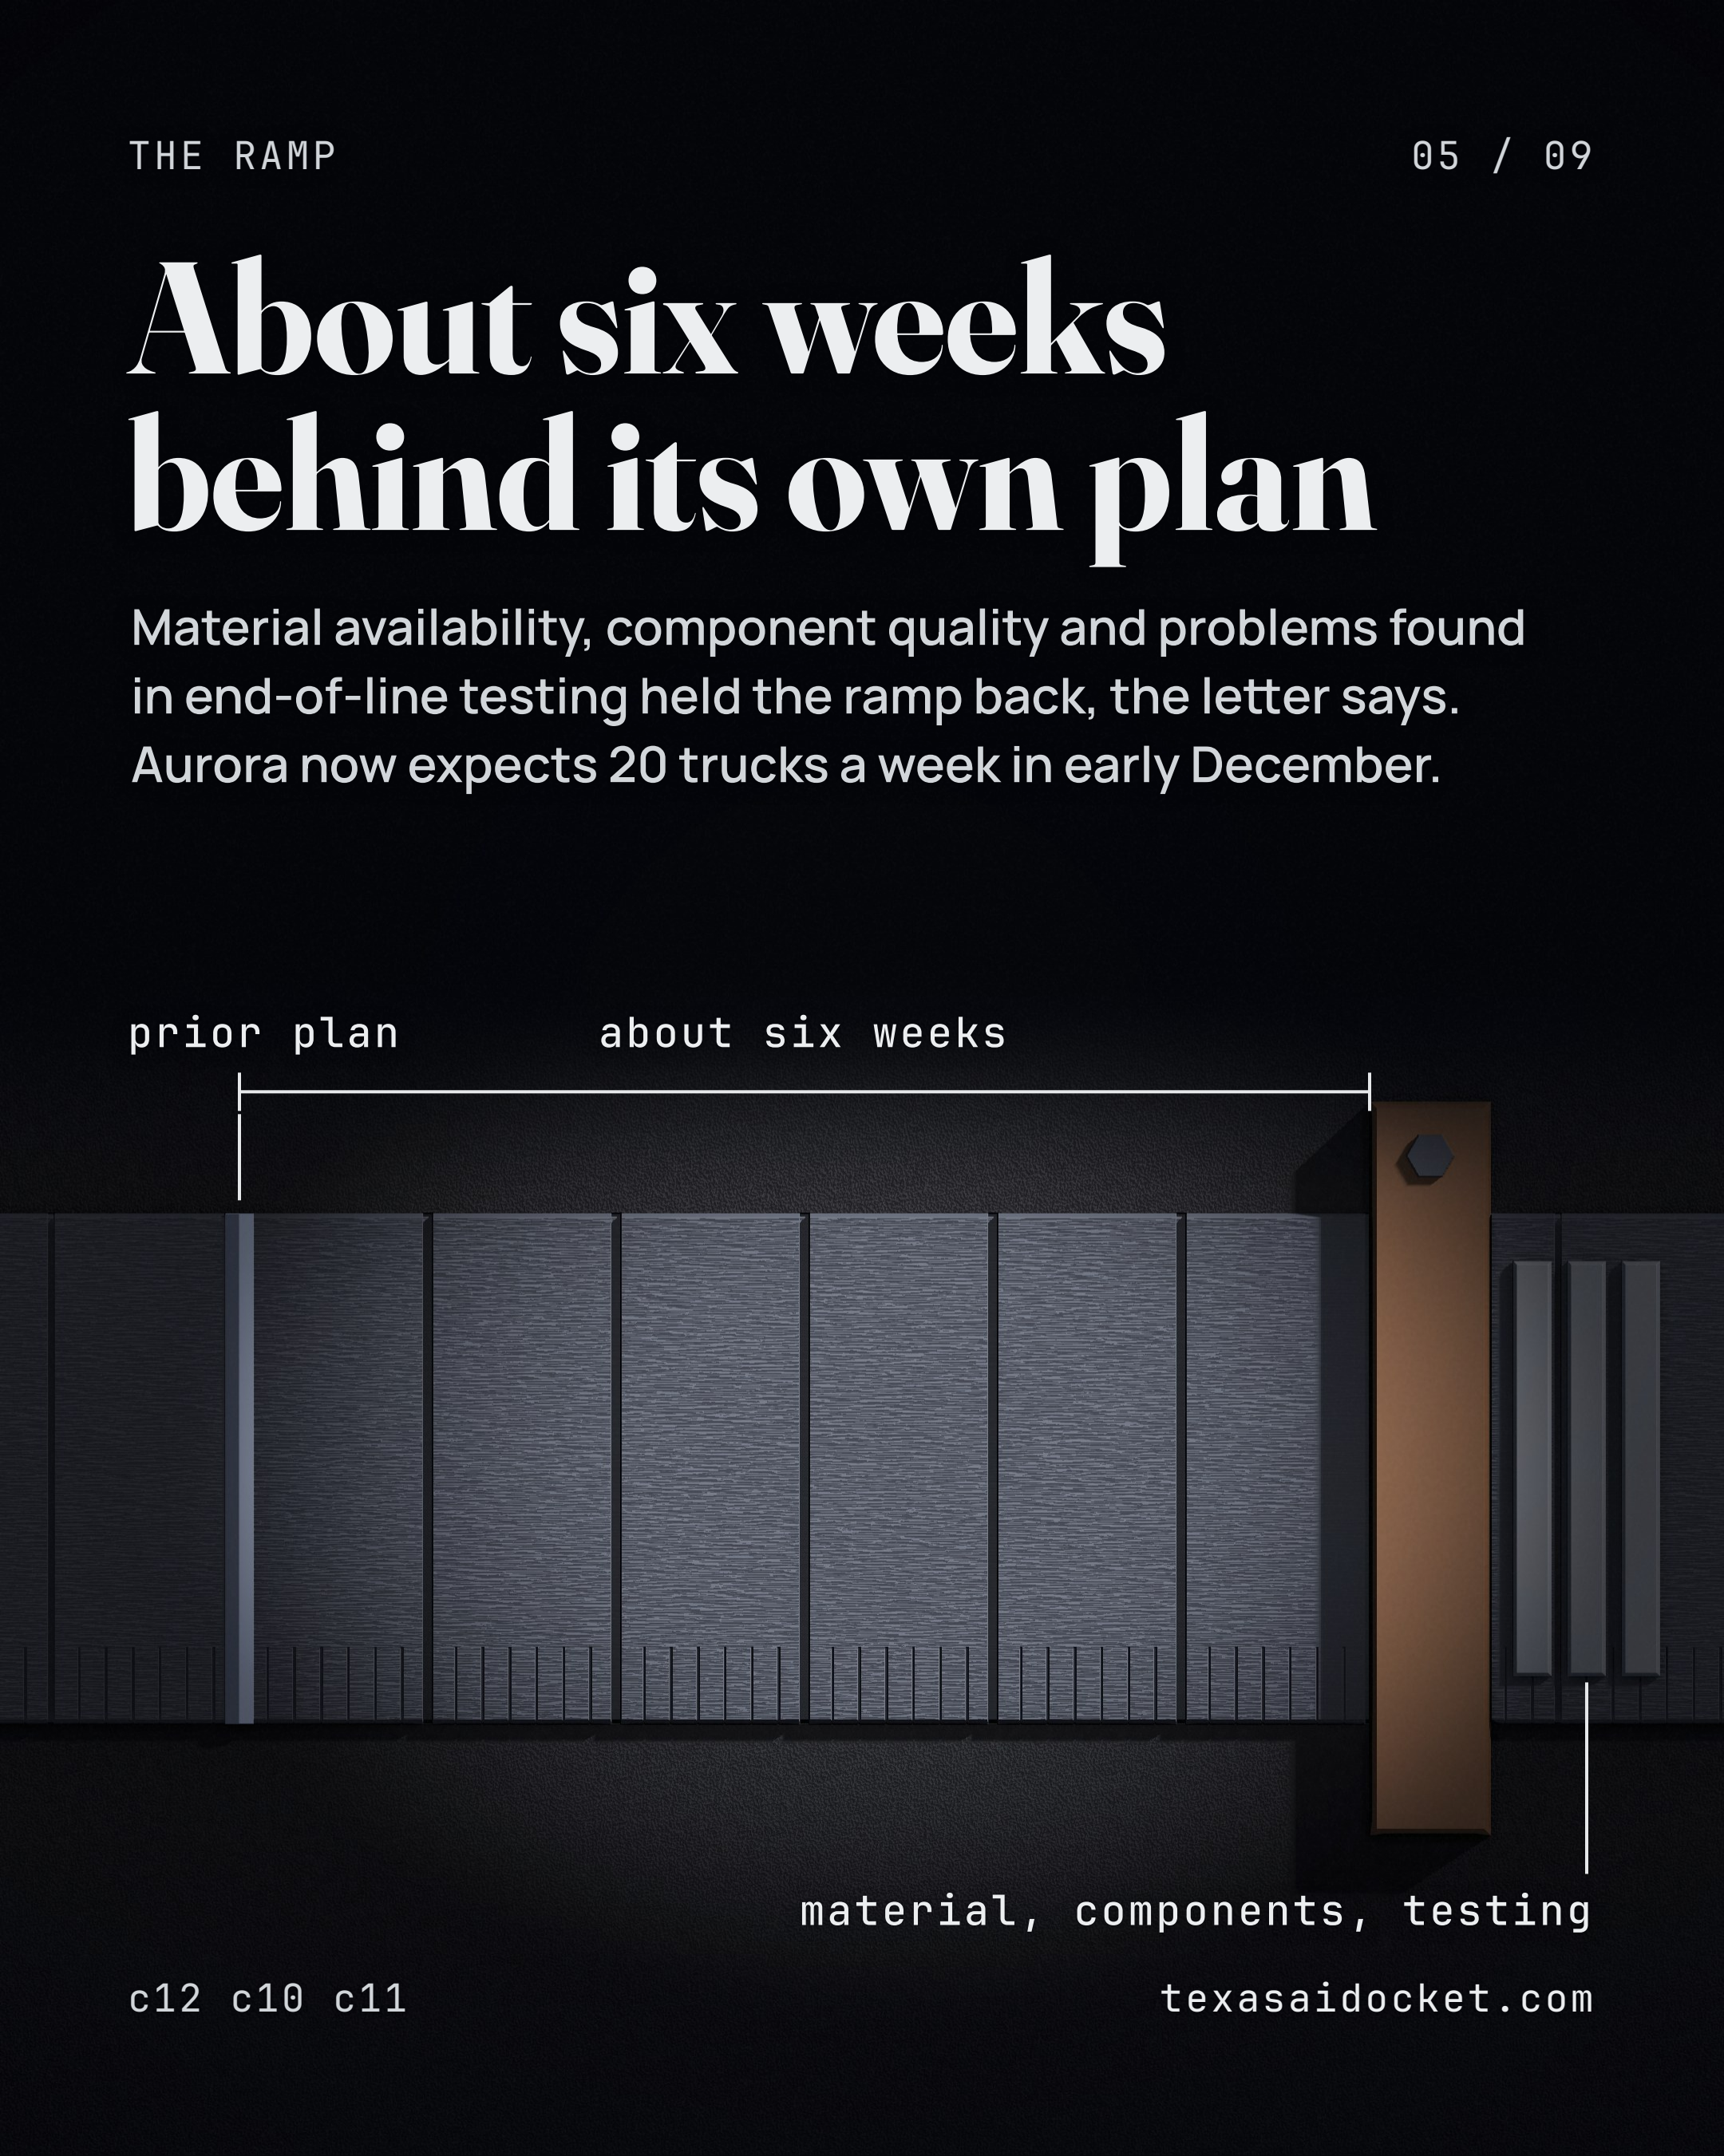

20+ driverless trucks are built

The letter says production is accelerating. The Aurora Driver passed 500,000 commercial driverless miles in September with 100% on-time delivery since launch, by Aurora's own count.

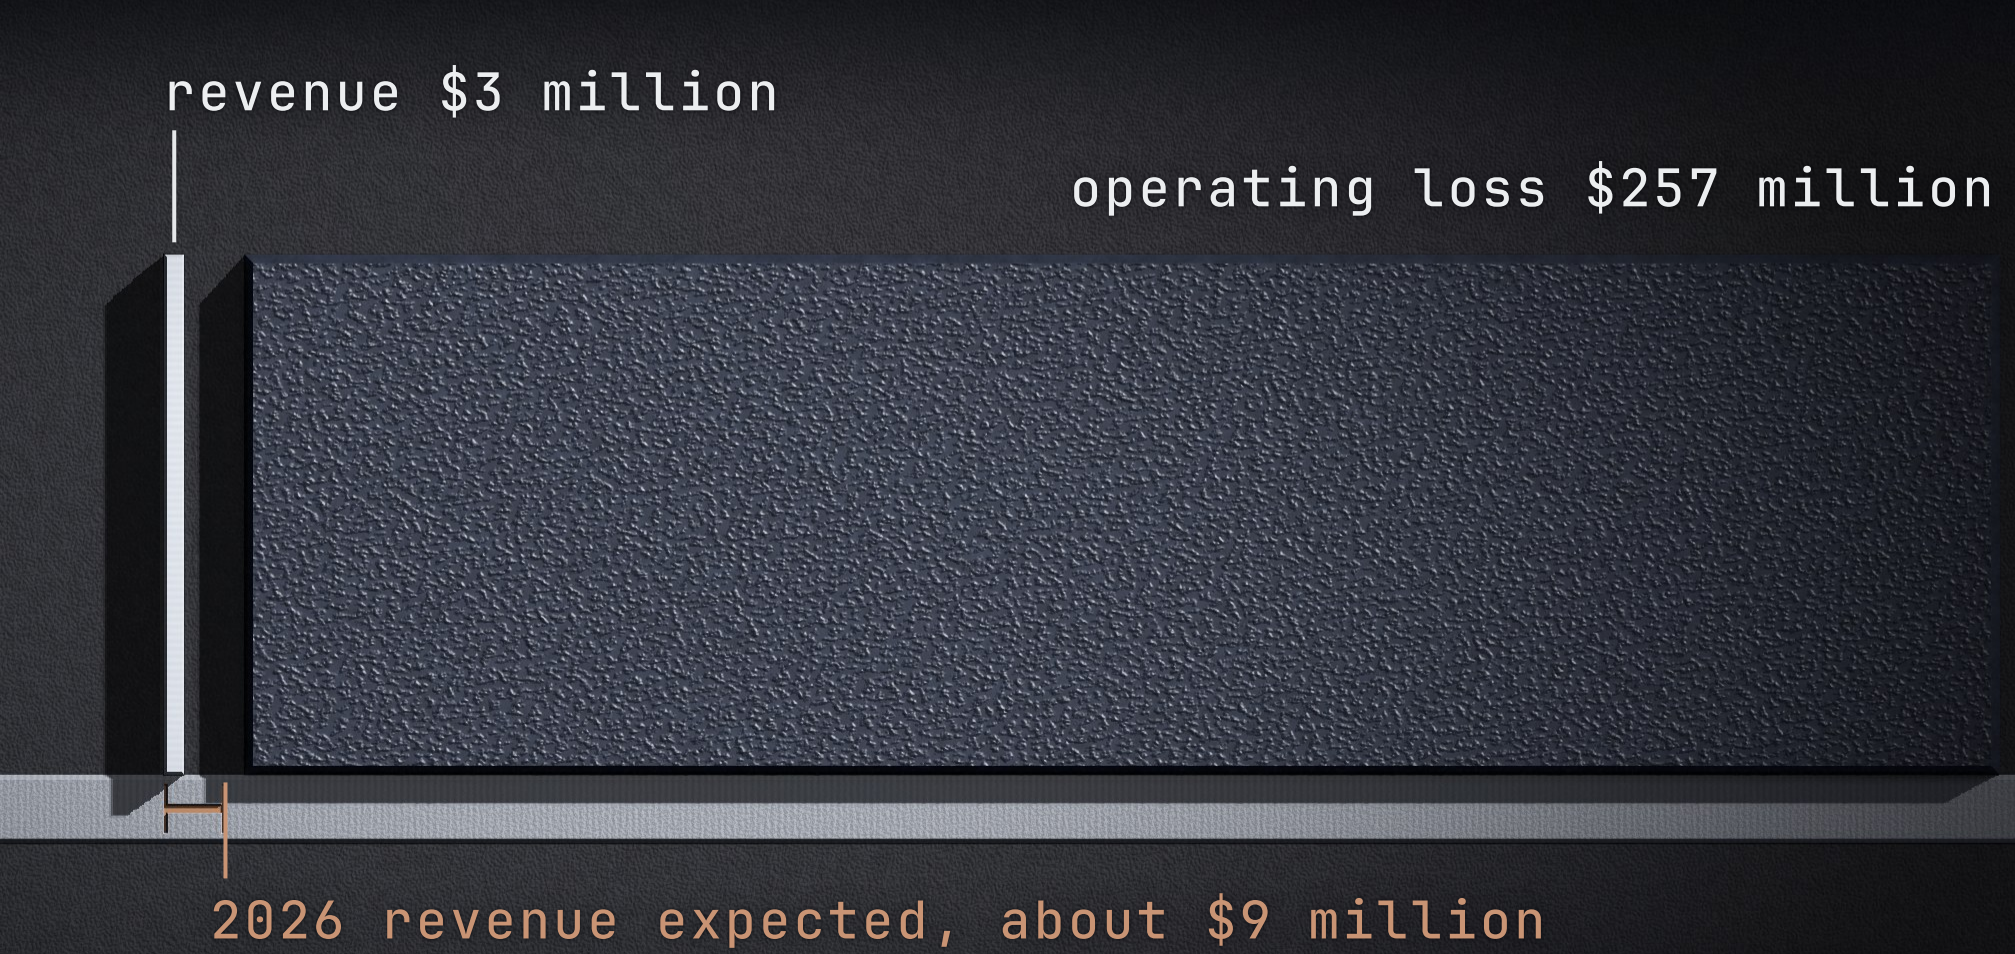

About six weeks behind its own plan

Material availability, component quality and problems found in end-of-line testing held the ramp back, the letter says. Aurora now expects 20 trucks a week in early December.

$3 million in revenue, a $257 million operating loss

Third quarter revenue and operating loss at one scale. The loss includes stock-based compensation. Aurora expects about $9 million of revenue for 2026.

Aurora's own route, and a customer's plan

Dallas to Houston is Aurora's own route. Charger Logistics plans to start between Dallas and Laredo under a non-binding MOU for 500 trucks, with delivery expected in 2027 and 2028. Routes drawn straight between places. New Braunfels is marked at Comal County's center.

When it stops, a light on the cab

The letter says FMCSA granted a five-year exemption letting driverless trucks use cab-mounted warning beacons in place of warning devices set out by hand.

From 20+ built to 1,000+ expected

Aurora expects more than 200 trucks by the end of February and more than 1,000 in operation at the end of 2027. Each primer stall is one expected truck. The filing is on the SEC's EDGAR site, dated October 28th.

more than 1,000 by end of 2027, expected

more than 200 by end of February, expected

20+ built
