

Not closed yet.

Kodiak AI named Interstate 45 from Dallas to Houston its first driverless long-haul lane. It says it closes its safety case before that launch, and at the end of August it called 93 percent of it complete. This van is loaded to that measure, one stack per point.

219 miles, mostly Interstate 45.

IKEA will be the launch shipper, on a leg of its route from Baytown to Frisco. Kodiak plans to run it with no one in the cab.

More than 1,300 loads for IKEA.

Kodiak says it has delivered more than 1,300 loads and logged more than 750,000 autonomous miles carrying IKEA goods over four years, with a safety observer aboard.

89 days left in the year.

Kodiak says it expects to launch driverless operations by year end. One post along the road ahead for each day left after October 3rd.

84. 86. 91. 93.

The share of its safety case’s claims and evidence Kodiak calls materially complete, by month in 2026. Each tape marks where the load stood. The doors are 100.

93 places loaded. 7 places bare.

One place on the floor for each point of Kodiak's own measure. The last 7 places are the share it didn't call complete at the end of August.

Every readiness figure is Kodiak's own.

The readiness measure is the company's account of its own safety case. Its release lists closing that case by year end among forward looking statements it says "are not predictions of actual performance."

The work left.

Kodiak founder and chief executive Don Burnette says the company has identified and scheduled the remaining work, and that it is concentrated on final engineering verification and validation.

More than 3.5 million miles. How many here?

Kodiak counts more than 3.5 million autonomous miles since 2019. Its release doesn't say how many of them ran between Dallas and Houston, the lane it means to open with no one in the cab.
